They were invented in 1980 by John Venn. Although probably used much earlier, the diagram was first generalized and popularized by Venn and thus got his name. Diagrams are simple to understand and build. It consists of two or more overlapping circles or ovals. Each circle in the diagram represents a topic or idea. This can vary greatly, and the diagrams are suitable for a wide range of almost endless topics from very large and generic to very small and specific. Most Venn diagrams are simply empty circles, but teachers can make chambers depending on their goals for the diagram and the needs of students. A shared accommodation for younger students can be extra lines or signs. This helps young students stay organized and can also guide the amount of information teachers expect to have in the diagram. You and your students will be both grateful in the end. In a three-circle diagram, circles should overlap in such a way that four overlapping sections are formed. Three of these sections compare the two circles and the middle part compares all three. When filling out a diagram, the information belongs to only one topic that is in the appropriate circle. Information shared by two of the topics is in the overlapping section for two circles. The information shared by all three topics lies in the middle overlap.
